## **DETAILED ACTION**

### ***Election/Restrictions***

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-7, drawn to a transgenic plant comprising a nucleotide sequence encoding a disease resistance polypeptide, and a method for producing said plant, classified in class 800, subclass 279, for example.
- II. Claims 8-10, drawn to a method for identifying a plant with increased resistance, classified in class 435, subclass 6, for example.

For the invention of Group I, election is also required from nucleic acid sequences encoding SEQ ID NO: 2, 3-17. Therefore, if Applicant elects Group I, Applicant is also required to elect one nucleic acid sequence.

Nucleic acid sequences encoding SEQ ID NO: 2, 3-17 are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions comprise structurally different nucleic acids encoding structurally distinct protein sequences. Also, the different sequences have different level of effects. In addition, since each nucleic acid/protein is disclosed in specific SEQ ID NO: the structural difference between the nucleic acid/protein sequences would not have obvious over each other.

Inventions I and II are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01).

Art Unit: 1638

The instant specification does not disclose that these methods would be used together. The plant transformation method and the method of selecting a plant are unrelated as they comprise distinct steps and utilize different products which demonstrate that each method has a different mode of operation. Each invention performs this function using structurally and functionally divergent material, and therefore the inventions I and II are patentably distinct. The methodology and materials necessary for selecting and testing a plant for the presence or absence of nucleic acids differ significantly from the methodology and materials for transforming a plant. Furthermore, the distinct steps and products require separate and distinct searches. The invention of Group I requires plant transformation and production of transgenic plants, while the method of Group II requires generation of non-transgenic plants. The inventions of Groups I and II have a separate status in the art as shown by their different classifications. As such, it would be burdensome to search the inventions of Groups I and IV together.

Because these inventions are distinct for the reasons given above, have acquired a separate status in the art as shown by their different classification, and the search required for each group is not required for the other groups because each group requires a different non-patent literature search due to each group comprising different products and/or method steps, restriction for examination purposes as indicated is proper.

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).

Art Unit: 1638

Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).
